

THE HOMELESS HOUND in Space

When my wonderful dog drifts off to slumber,

Or is he dreaming of soaring through deep outer space,

Is it food on his mind in a very large number?

Is that why when he sleeps, there's a smile on his face?

First he tries to get cream
from the Milky Way,
But that's our whole galaxy
— he learned that the hard
way!

MISSION CONTROL

Our solar system is located about 25,000 to 30,000 light-years from the center of the Milky Way.

Barred spiral galaxy, Contains an estimated 100 to 400 billion stars

Approximately 13.6 billion years,
100,000 light-years in diameter

Does he have fun
soaring close to the sun?
A 27 million degree core
that's too hot — no fun!

MISSION CONTROL

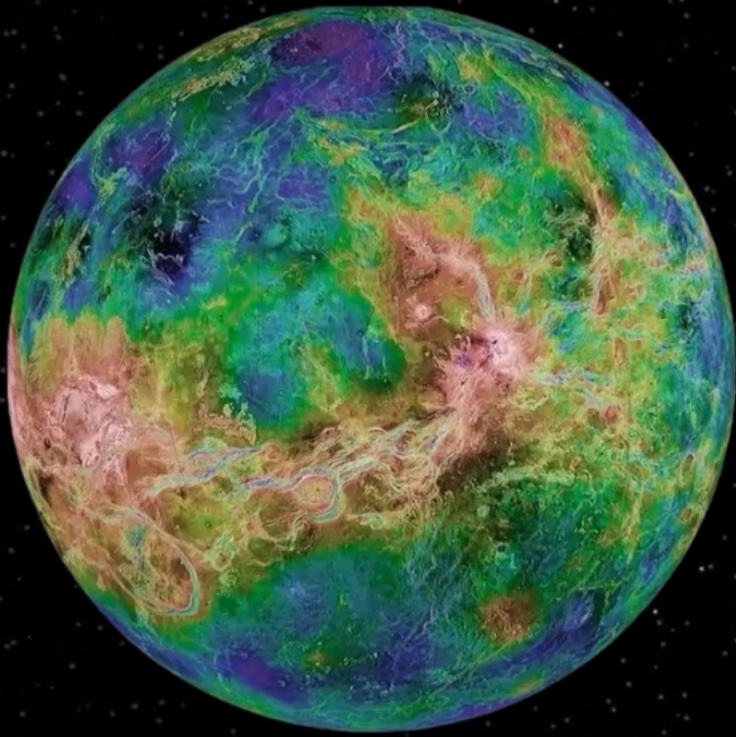

Our Sun is a medium star with a radius of about 435,000 mi(700,000 km)

The Sun formed about 4.6 billion years ago and accounts for 99.8% of our solar system's mass.

Surface temperature: (Photosphere) 10,000°F (5,500 degrees C)

Corona (solar atmosphere) temperature: Up to 3.5 million °F (2 million °C)

MISSION CONTROL

Named after the roman Goddess of Love, has no rings.

Venus' atmosphere is the hottest (about 872°F) apart from the Sun

Venus is between 24 million miles and 162 million miles away

Venus is the third brightest object in the sky after the Sun and Moon.

He swoops past bright
Venus, so smooth as
he saw it,
A glowing beautiful
planet, He had to read
a sonnet.

MISSION CONTROL

Earth is not a perfect sphere, bulging out slightly at the equator. It's Not Flat!

Earth is 93 million miles away from the sun, and a diameter of 7918 miles.

Earth is the only planet known to support life.

The atmosphere is primarily nitrogen and oxygen, with a mostly iron core.

Is the 5th largest planet in the solar system, 70% is covered by water.

He waves down at
Earth, spotting
Australia's Perth,
Of all the bright planets
there's none of more
worth.

He licks his chops floating
by our big Moon,
Past craters of Swiss
cheese he will return
soon.

MISSION CONTROL

The average distance from Earth to the Moon is 238,855 mi (384,400 km).

Twelve astronauts have walked on the Moon, during NASA's Apollo missions from 1969 to 1972.

Astronaut footprints on the Moon can last for millions of years due to the lack of wind and water erosion.

The Moon has eight distinct phases in its 27.3-day orbit around Earth.

MISSION CONTROL

Mars was named for the ancient Roman god of war, the Egyptians called it "Her Desher," meaning "the red one."

Mars has two small moons, Phobos and Deimos, that may be captured asteroids.

The reason Mars looks reddish is due to oxidization — or rusting — of iron in the rocks

Has a radius of 2,106 mi (3,390 km), Mars is about half the size of Earth.

He armors up cruising by
iron and magnesium-rich
Mars glowing red in the sky.

MISSION CONTROL

Jupiter is the largest planet in our solar system, capable of holding more than 1,300 Earths inside it.

The Great Red Spot is a massive storm is larger than Earth and has been raging for over 300 years.

Jupiter is primarily composed of hydrogen and helium, has 95 moons

Jupiter experiences winds that can reach speeds of 335 miles per hour

He focuses on the eye of the storm like a good photographer,
As he cruises through all of the moons of Jupiter.

MISSION CONTROL

Saturn is the sixth planet from the Sun and second largest, has 82 moons

It is primarily made of hydrogen and helium, making it a gas giant.

Saturn is less dense than water, meaning it would float if placed in a large enough body of water.

Upper atmosphere of Saturn can reach temperatures of -288°F (-178°C).

He counts the miles he
could earn,
Visiting all 83 moons of
Saturn.

MISSION CONTROL

Named for Uranus, the Greek god of the sky

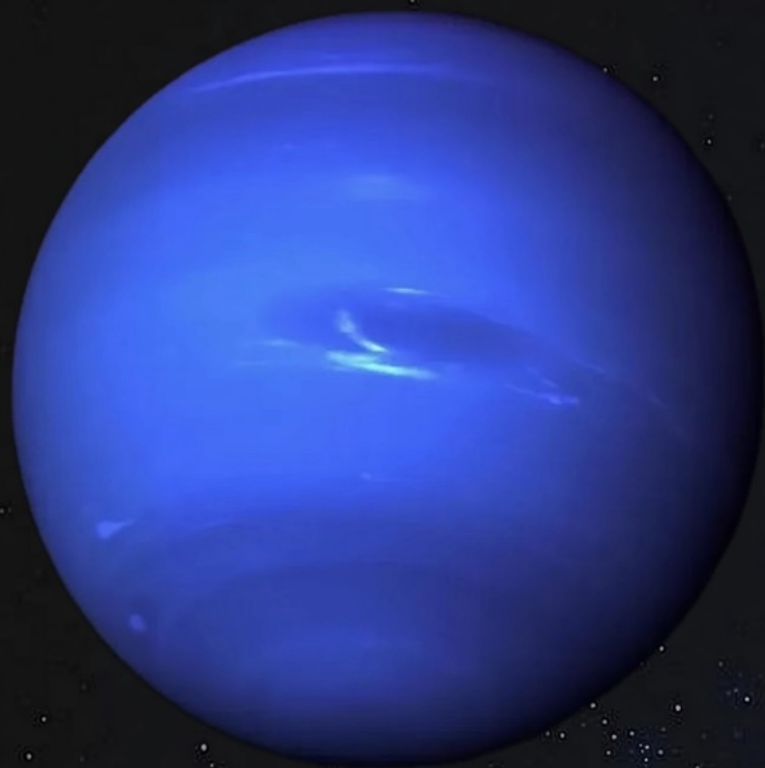

Equatorial diameter of 31,763mi (51,118 km, Uranus is 4x wider than Earth

Uranus has 28 known moons and 2 sets of rings

Wind speeds can reach up to 560 miles per hour (900 kilometers per hour)

Is he being courageous
way out by Uranus?
He braves the cold winds,
they will not faze us!

MISSION CONTROL

Neptune is the eighth planet from the sun has six rings and 14 known moons

The planet's blue color is due to the presence of methane in its atmosphere

A year on Neptune lasts 165 Earth years, a day on Neptune is 16 hours long

Is 30x farther from the Sun than Earth, 4.5 billion km (2.8 billion miles) away.

He floats like a bubble
past far away Neptune,
The last of the planets —
he'll be heading home
soon.

But the last look at Pluto,
Demoted by an astronomer,
That news must make
Mickey's dog GRRRRR!

MISSION CONTROL

Pluto has an equatorial diameter of about 1,477 miles (2,377 kilometers).

Pluto is 1/5th the width of Earth. Named for Roman god of the underworld.

Pluto's solar orbit takes 1736 dog years or 248 human

Pluto has five known moons: Charon, Nix, Hydra, Kerberos, and Styx.

MISSION CONTROL

Mercury is named after the Roman messenger god, reflecting the planet's rapid orbit around the Sun

Mercury is the smallest planet in our solar system and the closest to the Sun.

Mercury is the smallest planet in our solar system, only slightly larger than Earth's Moon.

Mercury has the fastest orbit of 88 Earth days, but a very slow rotation; A single day on Mercury takes 59 Earth days

Now with his journey
through space a great
victory,
He swings himself home
on the gravity of Mercury!

Starting to stir he awakens
from his nap,
Landing on terra firma — not
a star map.

He leaps and kisses his
mom after a yawn,
Proud of the stellar
adventure he was on
